DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1, 3-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Furukawa (U.S. Patent No. 6,115,614) in view of Sourour (U.S. Patent No. 6,157,820) further in view of Whinnett (U.S. Patent No. 6,192,256).

Regarding claim 1, Furukawa teaches a communication system (see fig. 5) comprising: at least one base station for modulating a carrier signal in response to a data stream (see fig. 5, col. 1, lines 5-14), which is to be transmitted by the base station (see col. 1, lines 26-27), in order to produce a modulated carrier signal and transmit the modulated carrier signal through at least two distinct propagation media (see fig. 13, and col. 7, lines 10-17); and at least one mobile station in communication with the base station for receiving the modulate carrier signal (see col. 3, lines 60-62), which undergoes distortion due to propagation through a medium (see col. 3, line 66-col. 4, line 6), wherein distinct pilot signals known by the mobile station (see fig. 3, col. 1, lines 26-31), are transmitted to the mobile station by the base station through each of the propagation media (see fig. 13 and fig. 3, col. 1, lines 26-31), and the mobile station receives the pilot signals as distorted pilot signals through each of the propagation media (see col. 2, lines 37-55 and col. 3, line 66-col. 4, line11), then compares the received distorted pilot signals to determine and predict propagation measurements (see col. 7, lines 17-27), and wherein

Art Unit: 2684

feedback information, which is determined therefrom, is transmitted from the mobile station to the base station (see col. 5, line 63-col. 6, line 6), then utilized by the base station to alter the characteristics of the modulated carrier signal prior to transmission (see col. 5, lines 22-30). But Furukawa fails to show the demodulating the distorted signal to recover the data stream; and base station comprising: at least two antennas coupled to the respective media; a transmission unit coupled to the respective antennas, wherein the transmission unit receives the data stream and modulates the carrier signal to produce the modulated carrier signal; and a calculation unit coupled to the transmission unit and the at least two antennas for receiving the feedback information from the mobile station, and modulated carrier signals being transmitted over each of the media are weighted.

However, Sourour teaches the demodulating the distorted signal to recover the data stream (see col. 2, lines 33-41).

Moreover, Whinnett teaches a base station (see figs. 1 and 7) comprising: at least two antennas coupled to the respective media (see figs. 1 and 7, col. 3, lines 11-32); a transmission unit coupled to the respective antennas (see fig. 2, col. 3, lines 33-53), wherein the transmission unit receives the data stream and modulates the carrier signal to produce the modulated carrier signal (see fig. 7, col. 10, lines 19-56 and col. 11, lines 4-18); and a calculation unit coupled to the transmission unit and the at least two antennas for receiving the feedback information from the mobile station (see figs 6-7, col. 9, line 55-col. 10, line 18), and modulated carrier signals being transmitted over each of the media are weighted (see col. 10, lines 19-56 and col. 11, lines 4-18).

Art Unit: 2684

Therefore, it would have been obvious to one of ordinary skill in the art at the time invention was made to modify Furukawa system and by the teaching of Sourour on the demodulating the distorted signal and by the teaching of Whinnett on the base station with two antennas and adjusts weight information thereto in order to provide system to demodulate a multi path fading channel and transmitting communication device adjusts the weight associated with the as least one of antennas associated to weight information received from the receiver (see whinnett col. 1, lines 40-55).

Regarding claim 3, Furukawa teaches wherein the base station transmits a distinct pilot signal to the mobile station (see col. 2, lines 37-55 and col. 3, line 66-col. 4, line 11). But Furukawa fails to teach base station transmits using each of the at least two antennas.

However, Whinnett teaches base station transmits using each of the at least two antennas (see figs 1-2 and 7, col. 3, lines 33-53).

Therefore, it would have been obvious to one of ordinary skill in the art at the time invention was made to modify Furukawa system and by the teaching of Sourour on the demodulating the distorted signal and by the teaching of Whinnett on the base station with two antennas and adjusts weight information thereto in order to provide system to demodulate a multi path fading channel and transmitting communication device adjusts the weight associated with the as least one of antennas associated to weight information received from the receiver (see whinnett col. 1, lines 40-55).

Art Unit: 2684

Regarding claim 4, Whinnett teaches wherein the predicted feedback information is transmitted from the mobile station to the base station via a feedback channel (see fig. 6, col. 9, line 55-col. 10, line 18).

3. Claims 5-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Furukawa (U.S. Patent No. 6,115,614) in vie of Tanay (U.S. Pub. No. 20030129987) in view of Desantis (U.S. Patent No. 5,628,052)

Regarding claim 5, Furukawa teaches a method for providing feedback from a mobile station to a base station base on predicted information (see col. 2, lines 33-60 and col. 3, lines 61-62), the method comprising: performing propagation measurements for a plurality of propagation media (see fig. 13, col. 7, lines 10-21); estimating a representative value for each of the at least two of the plurality of propagation media based on the propagation measurements (see fig. 13, col. 7, lines 10-33 and col. col. 5, lines 16-19); performing prediction of future propagation measurements for each of the plurality of propagation media (see fig. 13, col. 7, lines 10-33). But Furukawa fails to teach the feedback information based on prediction of future propagation measurements, and from at least two antennas.

However, Tanay the feedback information based on prediction of future propagation measurements (see page 6, session [0052], lines 19-27 and session [0055], lines 7-21).

Moreover, Desantis teaches propagation measurements at least two antennas (see figs 1 and 5, col. 2, lines 12-27).

Application/Control Number: 09/896,646

Art Unit: 2684

Therefore, it would have been obvious to one of ordinary skill in the art at the time

Page 6

invention was made to modify Furukawa system and by the teaching of Tanay on the feedback

information and also providing of the by teaching by Whinnett on two antennas technique,

thereto in order to provide the weighting factors so that the system can adjusts the interference

impact scores accordingly (see Tanay page 6, session [0052], lines 19-27).

Regarding claim 6, Desantis teaches the feedback information to the base station using a

feedback channel (see col. 2, lines 16-21).

Response to Arguments

Applicant's arguments with respect to claims 1 and 3-6 have been considered but are 4.

moot in view of the new ground(s) of rejection.

Conclusion

5. Any response to this action should be mailed to:

Commissioner of Patents and Trademarks

Washington, D.C. 20231

or faxed to:

(703) 872-9314, (for Technology Center 2600 only)

Hand-delivered responses should be brought to Crystal Park II. 2121 Crystal Drive, Arlington. VA., Sixth Floor (Receptionist).

Application/Control Number: 09/896,646

Art Unit: 2684

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tan Trinh whose telephone number is (703) 305-5622. The

Page 7

examiner can normally be reached on Monday-Friday from 9:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Nay Maung, can be reached at (703) 308-7745.

The fax phone number for the organization where this application or proceeding is

assigned is 703-872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding

should be directed to the Technology Center 2600 Customer Service Office whose telephone

number is (703) 306-0377.

Information regarding the status of an application may be obtained from the Patent 7.

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
